

# MacVector with Assembler 12.7

## for Mac OS X

### System Requirements

MacVector with Assembler 12.7 runs on any Intel Macintosh running **Mac OS X 10.5** or higher. There are no specific hardware requirements for MacVector – if your machine can run OS X 10.5 or above, it can run MacVector with Assembler. However, if you intend to make use of the Next Generation Sequencing Assembly functionality, we recommend you install as much RAM as you can afford or fit into the machine. For this type of analysis, the availability of RAM is perhaps more important than the speed or number of processors on the machine.

### Installation and License Activation

Both MacVector and the Assembler module are installed by double-clicking on the MacVector 12.7.pkg installer application. If you do not already have a valid MacVector with Assembler license installed on your machine, then you must enter a serial number and activation code the first time you run MacVector. This information is sent by e-mail and is also printed on the inside of the CD sleeve. You must have a valid MacVector with Assembler license to enable the Assembler functionality. If you use Sassafras Network Copy Protection, your system administrator should have been sent an additional license file to enable the Assembler functionality on the network KeyServer.

### Validating the Installation

After installation and license activation, you can verify that the Assembler has been installed correctly by running MacVector, then choosing the MacVector | About MacVector menu item. It should indicate you are using an Assembler enabled copy of MacVector with a screen similar to this;

## Support information

For assistance with MacVector, please contact your local MacVector, Inc office. You will need a current MacVector maintenance contract to be eligible for technical support other than for basic installation problems. New sales of MacVector include 12 months of support that also entitles you to any upgrades to MacVector released during the maintenance period.
